Week 2: DOM Manipulation · Lesson 14 ·

Lesson Notes

Discussion (18)

Using the `which` event property we can tell if the user pressed the keys down. Actually, we can even "listen" to see what specific keys they are typing. Let's make the NSA proud! This is 'merica goddammit and I'll listen in if I want to!

Add to *main.js*

```
/* 1. Grab the input value */

document.querySelector(".js-go").addEventListener('click', function() {

    var input = document.querySelector("input").value;
    console.log(input);
    pushToDOM(input);

});

document.querySelector(".js-userinput").addEventListener('keyup', function(e) {

    var input = document.querySelector("input").value;
    console.log(input);

    // if the key ENTER is pressed...
    if(e.which === 13) {
        pushToDOM(input);
    }

});

/* 2. do the data stuff with the API */

/* 3. Show me the GIFs */

function pushToDOM(input) {

    var container = document.querySelector(".js-container");
    container.innerHTML = input;

}
```
