Week 1: JavaScript Basics · Lesson 4 ·

☑ Completed

Lesson Notes   Transcript   Discussion (12)

At some point, you are going to have to write code that displays some output to the user. In JavaScript, you can write to the DOM (Document Object Model—we'll cover the DOM later, but basically, what's written to the DOM determines what's shown in the browser) using the document.write() function.

Print - Allows you to put things on the screen.

index.html

```html
<!DOCTYPE html>
<html>
    <head>
        <title>Oprah Likes You. And so do other people.</title>

        <style>

            /* Basic CSS comment */
            body {
                background: grey;
                color: white;
                width: 960px;
                margin: 0 auto;
            }

            h1 {
                font-size: 80px;
                color: #333 ;
            }

        </style>

        <script>
            /* this is an event */
            /* alert("I'm annoying"); */

            document.write("<h1>Hello Chris!</h1>");

        </script>

    </head>

    <body>

    </body>

</html>
```
